

1. A jar contains 5 red, 9 blue and 14 white marbles. If a marble is drawn from the jar at random, then what is the probability that the marble is neither red nor white?

1. 5 red, 9 blue, 14 white

Neither red nor white  $\Rightarrow$  Blue marble

$$\therefore P(\text{Blue}) = \frac{9}{5+9+14}$$

2. I toss a coin three times. What is the probability of getting a head at most two times?

Sample Space

$$\{ HHH, HHT, HTH, THH, HTT, TTH, THT, TTT \}$$

Atmost 2 heads implies that we have either 1 head or 2 heads.

$\therefore$  Favorable cases are

$$\{ HTT, TTH, THT, HHT, HTH, THH \}$$

$$\therefore P(\text{Atmost 2 heads}) = \frac{6}{8} = \frac{3}{4}$$

3. If I roll two dice simultaneously, then what is the probability of getting the numbers such that their sum is odd?

Sample Space for two dice :

|       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|
| (1,1) | (1,2) | (1,3) | (1,4) | (1,5) | (1,6) |
| (2,1) | (2,2) | -     | -     | -     | (2,6) |
| ⋮     | ⋮     | -     | -     | -     | ⋮     |
| (6,1) | (6,2) | -     | -     | -     | (6,6) |

Now, for the sum to be odd one of the dice has an even number and the other an odd number

Case-1 : Die 1 : odd Die 2 : even

we have  $3 \times 3 \rightarrow 9$  cases

Case-2 : Die 2 : odd Die : even

$3 \times 3 \rightarrow 9$  cases

$\therefore \frac{18}{36}$  is the required probability

4. Two cards are drawn randomly from a pack of 52 cards. Find the probability that both cards are aces?
- a. For the case where cards are drawn with replacement.
- b. For the case where cards are drawn without replacement.

(a) we have 4 aces.

With replacement probability is

$$\frac{4C_2}{52C_2}$$

(b) Without replacement probability is

$$\frac{4C_1}{52C_1} \times \frac{3C_1}{51C_1} = \frac{4}{52} \times \frac{3}{51}$$

5. There are two events A and B. Assume  $P(A) = 0.25$ ,  $P(B) = 0.45$ , and  $P(A \cap B) = 0.1$ .
- a. What is  $P(A \cup B)$ ?
- b. What is  $P(A' \cap B)$ ?

$$P(A) = 0.25 \quad P(B) = 0.45 \quad P(A \cap B) = 0.1$$

$$\begin{aligned} \text{a. } P(A \cup B) &= P(A) + P(B) - P(A \cap B) \\ &= 0.25 + 0.45 - 0.1 \\ &= 0.6 \end{aligned}$$

$$\begin{aligned} \text{b. } P(A' \cap B) &= P(B) - P(A \cap B) \\ &= 0.45 - 0.1 \\ &= 0.35 \end{aligned}$$

6. Consider two sets X and Y.

$$X = \{A, B, C, D, E\}$$

$$Y = \{P, Q, R, S, T, U\}$$

If you select one letter each from X and Y, then find the probability of

a. Getting an A and T.

b. Getting an A or T.

$$a. \quad \frac{1}{5} \times \frac{1}{6} \quad \left[ P(A) = \frac{1}{5} \quad P(T) = \frac{1}{6} \right]$$

$\underbrace{\hspace{1cm}}$   
 Nothing but  $P(A \cap T)$

$$b. \quad P(A \cup T) = P(A) + P(T) - P(A \cap T)$$

$$= \frac{1}{5} + \frac{1}{6} - \frac{1}{30}$$

$$= \frac{1}{3}$$

7. In ABC, there are 300 IT employees and 100 Management employees. 20% of IT employees have a college education and 40% of Management employees have college education. If one employee is randomly chosen for promotion, then find the probability that the employee is Management employee and has college education?

$$P(\text{of randomly choosing an employee}) = \frac{1}{400}$$

$$P(\text{Management employee}) = \frac{100}{400} = \frac{1}{4}$$

$$P(\text{College education} / \text{Management}) = 0.4$$

$\therefore$  our probability of interest is

$$\frac{1}{400} \times \frac{1}{4} \times 0.4$$
